Hints on integrating gpg

Wrapping Up

Versions

- ▶ GnuPG 2.2 released a few weeks ago.
- ▶ 2.1 has been around for nearly 3 years.
- ▶ New features
 - Easy key discovery for any mail address.
 - Full separation between private key and gpg
 - Curve25519 support
 - Better CLI support
 - ...
- ▶ End of life for 2.0 in 3 months.
- ▶ We keep 1.4 for its PGP-2 support and portability to pre-POSIX systems.

What's next

- ▶ RFC-4880bis work in 2.3
 - AEAD mode
 - SHA-256 fingerprint
 - New default algos
- ▶ “Moving up the stack”:
 - Help integrating new features
 - Checking existing use
- ▶ Make GnuK easier available
- ▶ Write more than reference manuals.

Why ECC (1)

- ▶ ECC algorithms are very well researched.
- ▶ Instead of key sizes we speak of different curves
- ▶ For RSA et al. one implementation fits all sizes.
- ▶ For ECC each curve needs to be implemented separately.
 - A large class of curves can be implemented using a table of parameters.

Why ECC (2)

- ▶ Certain curves have a bad repudiation.
- ▶ In particular the NIST curves as required for Suite B.
- ▶ European Brainpool curves might be better ...
... still are too similar to the NIST curves.

So let's move on.

The new de-facto standard (RFC-7748) is:

- ▶ Curve25519
- ▶ Curve448-Goldilocks
- ▶ Variants for use with EdDSA

Why ECC (2)

- ▶ Certain curves have a bad repudiation.
- ▶ In particular the NIST curves as required for Suite B.
- ▶ European Brainpool curves might be better ...
... still are too similar to the NIST curves.

So let's move on.

The new de-facto standard (RFC-7748) is:

- ▶ Curve25519
- ▶ Curve448-Goldilocks
- ▶ Variants for use with EdDSA

Performance

Zeitcontrol and GnuK tokens:

(milliseconds measured inside gpg on an X220)

cpu	algo	sign	(verify)
nxp	rsa2048	470	0.1
nxp	rsa4096	2800	0.9
stm32	ed25519	45	6.0

- ▶ RSA is 60 times slower than Ed25519 for signing.
- ▶ RSA is always fast as lightning for verification.
- ▶ Our Ed25519 verification code is a bit slow.

Hints on integrating gpg

Wrapping Up

Gpg and its prompts

- ▶ Written as replacement for PGP-2.
- ▶ Direct the user into the right direction
- ▶ LibGPGME for common tasks
- ▶ Hard to automate (requires FSM)

Better API?

- ▶ Too many options and uncertainty which are really needed.
- ▶ Meanwhile we know the common use patterns ...

Let's welcome the `-quick-foo` commands.

Gpg and its prompts

- ▶ Written as replacement for PGP-2.
- ▶ Direct the user into the right direction
- ▶ LibGPGME for common tasks
- ▶ Hard to automate (requires FSM)

Better API?

- ▶ Too many options and uncertainty which are really needed.
- ▶ Meanwhile we know the common use patterns ...

Let's welcome the `-quick-foo` commands.

Gpg and its prompts

- ▶ Written as replacement for PGP-2.
- ▶ Direct the user into the right direction
- ▶ LibGPGME for common tasks
- ▶ Hard to automate (requires FSM)

Better API?

- ▶ Too many options and uncertainty which are really needed.
- ▶ Meanwhile we know the common use patterns ...

Let's welcome the `-quick-foo` commands.

Key generation

```
$ gpg --quick-generate-key USER_ID [ALGO [USAGE [EXPIRE]]]
```

Try "future-default" for ALGO.

If you don't want a passphrase, do this

```
$ gpg --passphrase '' --batch --quick-generate-key USER_ID
```

Changing the expiration date

- ▶ The default is to create keys which expire in two years.
- ▶ OpenPGP allows to prolong the expiration date.

To set the expiration to 2 years from now:

```
$ gpg --quick-set-expire FINGERPRINT -
```

Adding a subkey

Subkeys are very useful for key management. Adding more subkeys is easy:

```
$ gpg --quick-add-key FINGERPRINT [ALGO [USAGE [EXPIRE]]]
```

Adding/Revoking a user id

Got a new mail address?

```
$ gpg --quick-add-uid FINGERPRINT NEW_USER_ID
```

Lost that address?

```
$ gpg --quick-revoke-uid FINGERPRINT USER_ID
```

Tell others which user id to see:

```
$ gpg --quick-set-primary-uid FINGERPRINT USER_ID
```

Key signing

Key signing party:

```
$ gpg --quick-sign-key FINGERPRINT [NAMES]
```

Mark a key locally as verified:

```
$ gpg --quick-lsign-key FINGERPRINT [NAMES]
```

Encryption w/o a keyring

Instead of importing a key and using its fingerprint, the `-f` option can be used:

```
$ gpg -f FILE_WITH_KEY -e DATA
```

The new export filters can be used to create a key file.

Modern algos

The Quick commands

Keyservers and such

Hints on integrating gpg

Wrapping Up

Key discovery

- ▶ Keyservers can't map an address to a key.
- ▶ Only the mail provider can do that.
- ▶ Mail addresses are not under the user's authority like their keys are.
- ▶ Mail provider provides the key (web key directory).
- ▶ Keyservers are decentralized; this is a Good Thing™.
- ▶ Verifying keyservers harm the PGP ecosystem.
 - They need to be under a single authority.
 - The return of the X.500 dilemma.

Key discovery

- ▶ Keyservers are decentralized; this is a Good Thing™.
- ▶ Verifying keyservers harm the PGP ecosystem.
 - They need to be under a single authority.
 - The return of the X.500 dilemma.

Key Validation

- ▶ The Web-of-Trust is a geek's instrument.
 - Hard to explain.
 - Global social graph.
 - It does not scale.
- ▶ The Trust On First Use (TOFU) paradigm is better.
 - Easy to explain. ✓
 - Local. ✓
 - Keeps the PGP properties. ✓

Wrapping Up

The two interfaces — human

- ▶ This is plainly for human consumption
- ▶ Translated.
- ▶ Uses the native charset
- ▶ Strings may change with each release

Never use it for scripting!

The two interfaces — machine

- ▶ This is mainly for scripting
- ▶ Fixed strings
- ▶ Always UTF-8
- ▶ Only compatible changes since 1.0

Enable this interface using

```
--batch --with-colons --status-fd=2
```

When using the interactor (`--command-fd`) leave out `--batch`.
"awk -F:" is your friend. See `doc/DETAILS` for a full description.

Import and export filter

Remove funny signatures. My gpg.conf:

```
import-filter drop-sig= sig_created_d=2015-12-24
import-filter drop-sig=|| sig_created_d=2016-03-16
```

Show keys in a file

```
$ gpg --import-options show-only --import FILE
```

Export only the userids with a given mail address

```
$ gpg -a --export-options=export-minimal \  
  --export-filter keep-uid=mbox=wk@gnupg.org \  
  --export FINGERPRINT
```

Ssh-agent

It is more than 10 years old:

```
$ ssh-add
```

transfers existing keys into GnuPG's key store and makes them permanent.

- ▶ Works nicely with smartcards
- ▶ Use a subkey for ssh
- ▶ ssh-add still works
- ▶ You can't live without it.

GnuPG 2.2

- ▶ Modern algos
- ▶ Better scriptability
- ▶ Auto key discovery when a mail address is given.
 - We need to talk to providers.
- ▶ Take care:
 - Debian has 2.1.18 plus some changes.
 - Ubuntu has a partly broken 2.1.11

Thanks for listening. Questions?
